

BugSnag			
Problem Statement	Development teams building high-stakes mobile and web apps face growing pressure to protect revenue and retention, but slow, manual debugging and alert fatigue make it challenging to resolve user-impacting issues fast. Finding and fixing what's broken quickly is especially important during critical conversion moments like completing a purchase, booking a room, or streaming a show, when subpar customer experiences can impact reputation and profit.		
Value Proposition	BugSnag helps development teams protect revenue and customer trust by surfacing errors with full context out of the box, enabling them to understand impact and root cause fast, ship with confidence, and avoid alert fatigue and unpredictable costs.		
Value Drivers	Protect customer trust, revenue	Diagnose issues faster	Predictable costs
The Problem	Customers expect flawless app experiences. Anything less than that erodes trust, weakens your brand, and can cause them to take their business to a competitor, hurting your bottom line.	APM tools produce alerts and generate tons of data but don't connect the dots between issues and root causes, leaving developers to manually piece together what went wrong. Noisy dashboards and alert fatigue mean hours spent correlating data when developers could be shipping features and releases instead.	Observability costs spiral out of control as you scale - what starts as a reasonable monthly bill soon exceeds what's budgeted, forcing teams to choose between visibility and budget.
Positive Business Outcomes	Stable apps allow users to complete activities that are key to driving revenue, such as purchasing items, ordering a meal, or streaming an album.	Drives efficient use of time with less tool switching. Reduces MTTR by helping identify, prioritize and fix errors and app crashes faster. Less time spent debugging means more time innovating new features.	Predictable billing helps you avoid massive surprise bills. Make confident investments in your business, with peace of mind that your observability costs are consistent.
Differentiators	BugSnag's user-friendly UI shows data on what's broken, who's impacted, and the root cause out of the box, so developers can move from alert to fix quickly minimizing customer disruption. Other tools add noise and work by overwhelming engineers with logs they have to piece together.	BugSnag gives developers a faster path to resolution with pre-configured dashboards, an intuitive UI, and root cause data surfaced clearly - no need to sift through logs. Unlike traditional APMs or generic observability tools, BugSnag is purpose-built for developers to quickly prioritize issues by severity and user impact, take action through custom alerts, and get value from day one, making it the clear choice for teams that need to move fast and fix faster.	Predictable pricing with dynamic sampling and rate limiting prevents you from receiving surprise bills and burst protection protects against unexpected or seasonal spikes in errors that use up quotas.
Capabilities	<u>Pre-configured dashboards</u> <u>Stability scores</u> <u>Error grouping</u> <u>Breadcrumbs</u> <u>Timeline view</u> <u>Pivot tables</u> <u>Waterfall graphs</u> <u>System metrics</u>	<u>Pre-configured dashboards</u> <u>Error grouping</u> <u>Automatic error assignment</u> <u>Custom error and performance filters</u> <u>Feature flags</u> <u>Integrations with commonly used tools</u> <u>MCP server</u>	<u>Dynamic sampling</u> <u>Burst protection</u> <u>Discarding and per-project event caps</u>
Proof Points	Doximity achieved 99.99% application stability and an improved user experience.	With the context BugSnag gives, developers at HotelTonight find and fix bugs 50-60% faster and save at least 40 hours per month finding and fixing bugs	Chick-Fil-A : "We are happy to keep moving more spend from Datadog to BugSnag if BugSnag keeps providing cleaner insights and ergonomics."
