

Hunters is Named a Fast Moving Leader in the GigaOm Radar for Security Information and Event Management (SIEM)

On July 30, 2024 GigaOm released the Radar for Security Information and Event Management (SIEM). This report examines 24 of the top SIEM solutions and compares offerings to help decision makers make more informed investment decisions.

Hunters is named a Fast Moving Leader in the report, as you can see in the graphic below.

Last year Hunters was not included in this report since it was not in the SIEM category at the time, so this is a great result we should all be proud of!

We have licensed the full report for distribution for 12 months, located here.

Key Takeaways

- Hunters was named a Fast Moving Leader in the Innovation/Platform Play quadrant
- Vendors in this quadrant “offer SIEM capabilities that natively integrate SOAR-like capabilities and score well across emerging technologies.”
 - Hunters scored well on emerging features such as LLM integrations and DevSecOps.
- Hunters was also recognized for the unique value we deliver to customers, including:
 - **Removing any false positives and excessive alerting**, with distinguishing capabilities for alert calibration, curation, and correlation
 - **Reducing redundant triage efforts** by aggregating new leads with other similar leads
 - **Automatically enriching and contextualizing data** using various sources from the customer’s environment
 - **Providing a holistic view of threats** with detailed Attack Stories that help customers understand the entire timeline of an attack and respond effectively
 - **Allowing analysts to quickly identify and scope the root cause of a threat**, its prevalence, and its impact on the organization
 - Newly released features, such as host investigation, multiple data lake support for running on Snowflake and Databricks, DQL-as-Detection, Detection-as-code and workflows for defining no-code automation playbooks for ticketing, chatops, email, or other systems
- The only challenge cited is also an advantage, depending on the customer, which GigaOm noted.
 - “Hunters is an opinionated platform that offers less flexibility than some solutions, especially compared to solutions built on top of open source software. This approach can be both an advantage and a disadvantage depending on the level of control needed and willingness to invest development resources.”

For companies in our ICP (SOCs with 5-12 analysts that want to use automation/technology to reduce noise alert instead of hiring more analysts, deploying their first SIEM, are interested in using/already using the cloud), they want an opinionated platform because they want a SIEM that requires little tuning/development and works pretty much out of the box for fast value and ROI.

- Hunters has strong momentum in the market.
 - Hunters received an honorable mention in the [Gartner Magic Quadrant for Security Information and Event Management](#), which was issued in May.
 - In November 2023, GigaOm named Hunters a Leader and Outperformer in the [Autonomous SOC Radar Report](#).
 - Snowflake, a key partner, named Hunters a leader in their report [The Next Generation of Cybersecurity Applications](#). Our ability to offer customers a cost-effective approach to storing security data compared to traditional SIEMs was called out along with how we let companies create a security data lake using

Snowflake. We were also included in Snowflake's [CISO's guide to SIEM migration](#).

Competition

While we don't have full visibility into why our competitors were placed where they were in the graphic, we can comment on what we think the contributing factors are based on the writeup.

- **Securonix:** Named a leader and outperformer in the Innovation/Platform Play quadrant. Recognized for native and robust SaaS deployment model, BYO Cloud, using ML at its core, and Threat Research Lab. Dinged for learning curve and user experience.
- **Panther:** Named an Entrant and Fast Mover in the Innovation/Feature Quadrant. Scored well on emerging technologies such as DevSecOps and security content. Scored low on the key decision criteria. The report notes Panther is limited to monitoring AWS environments and lacks native SOAR-like capabilities.
- **Sumo Logic:** Named a Leader and Fast Mover because it offers a SaaS-based product built on an analytics platform, with a good release cadence. Sumo Logic moved this year from the Maturity/Platform Play quadrant to the Innovation/Platform Play quadrant. Worth noting that it was bought by a private equity firm in May 2023 and private firms are known for cutting costs.
- **Exabeam/LogRhythm:** The report evaluated each company separately (both were ranked Challengers and Fast Movers) but noted that the two merged in May 2024. The report cautioned that there are few plans on what the merged company will look like and said to expect medium-term disruption until integration is complete.
- **Microsoft:** Named a Leader and Fast Mover. Report noted that Sentinel can only be deployed on Azure, which won't work for companies that aren't using Azure. And getting a true cost of ownership for Sentinel is very challenging, as [our battlecard notes](#).
- **Splunk:** Named a Challenger and Fast Mover. Report noted that Splunk Enterprise Security is a premium app that must be used with either Splunk Enterprise or Splunk Cloud Platform. In other words, you have to buy or already use other Splunk products to use their SIEM product, creating vendor lock-in.

Google, CrowdStrike, Anvilogic, Palo Alto Networks, and Gurukul were not included in this report. Use this against these competitors.

External Messaging

When discussing the report externally, please use the following messaging.

Elevator pitch (for customers/prospects)

Hunters was named a Fast Moving Leader in the Innovation/Platform Play quadrant of the 2024 GigaOm Radar for SIEM.

Vendors in this quadrant offer “SIEM capabilities that natively integrate SOAR-like capabilities and score well across emerging technologies.”

Hunters was recognized for automating the entire threat detection, investigation, and response process, including:

- **Removing any false positives and excessive alerting**, with distinguishing capabilities for alert calibration, curation, and correlation
- **Reducing redundant triage efforts** by aggregating new leads with other similar leads
- **Automatically enriching and contextualizing data** using various sources from the customer’s environment
- **Providing a holistic view of threats** with detailed Attack Stories that help customers understand the entire timeline of an attack and respond effectively
- **Allowing analysts to quickly identify and scope the root cause of a threat**, its prevalence, and its impact on the organization

The detailed report can be found here. For additional third-party validation of Hunters, you can review our market leading results in the [GigaOm Autonomous SOC Radar Report](#), Snowflake report on [The Next Generation of Cybersecurity Applications](#), and the [Gartner MQ for SIEM](#).

Objection Handling

Why wasn’t Hunters named an Outperformer?

- The Outperformer/Fast Mover/Forward Mover denomination represents pace of progress or development, and outperformer is difficult to achieve (only 4 out of 24 vendors did). GigaOm praised Hunters’ consistent release train in the report, and we are proud to be named a Fast Mover.

How was [competitor] positioned relative to Hunters?

- Use the external elevator pitch + the competitor talking points above.

Why is GigaOm calling out Hunters for being an opinionated platform that offers less flexibility?

- Hunters is proud to be an opinionated platform. The platform decides, for example, how to prioritize alerts and what signals to extract and group together. Our goal is to revolutionize SIEM from a painful experience that requires significant management and overhead, to a low-touch, low-maintenance platform focused on outcomes and efficiency. As GigaOm notes, this is also a strength.
